

Global Warming: A State Analysis

Kristof, Emory. "Tennessee Power Plant", United States." *National Geographic*.

Overview

Global warming refers to the long-term increase in Earth's average surface temperature due to human activities, primarily the emission of greenhouse gases like carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O). These gases trap heat in the atmosphere, creating a "greenhouse effect" that intensifies the warming of the planet. While Earth's climate has naturally fluctuated over geological timescales, the current rate of warming is significantly faster than can be explained by natural processes, such as volcanic activity or variations in solar radiation. This accelerated warming has been driven largely by industrialization, deforestation, energy production from fossil fuels, and other human behaviors.

Dangers

Global warming contributes to a range of environmental changes, including rising sea levels, melting polar ice, more extreme weather events, disruptions to ecosystems, and threats to biodiversity. It is a critical component of broader climate change, which encompasses shifts in weather patterns, ocean currents, and other climate systems.

**Only 63.26% of
National
Population
Concerned!**

The Report

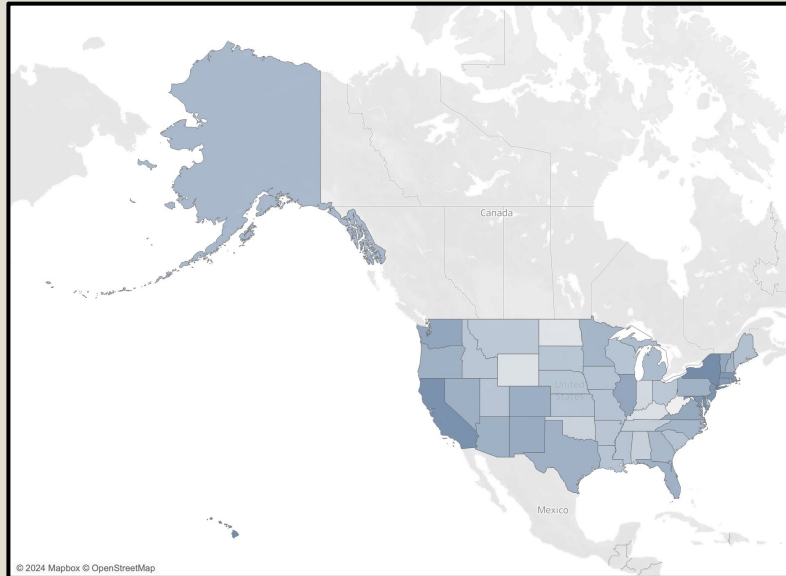

The report will offer insights into how states compare to the national percentage of citizens concerned with Global Warming. It will also compare factors like each state's political ideology, education, and economy to provide more information on what factors influence global warming attitudes.

The Data

This dataset was constructed by Sociologist Evan Cooper of Farmingdale State College, Farmingdale NY and supplemented by Sociologist Beth Ann Whitaker of the University of Michigan, Ann Arbor, MI by combining state-level publicly available data from a variety of sources.

How Does Concern for Global Warming Compare by State?

The dataset estimated the percentage of each state's population who are worried about global warming. This was reported as percentages, the higher meaning more of the population is concerned with global warming.

The Average Concern:
60.96 with a Standard
Deviation of 5.27

Most Concerned State:
New York at 72.06

Least Concerned
State:
West Virginia at
49.18

Factors that May be Linked to Global Warming Concern Levels:

Education

Economy

**Political
Ideology**

Education

Why it could be influential:

Those who are more highly educated have had more exposure with the concept of global warming, and are more familiar with the factors that cause it. This could cause them to be more concerned.

How the states compare:

- The highest education level is Massachusetts, which is above averagely concerned.
- West Virginia is the lowest in education level, and in concern

Economy

Why it could be influential:

Places with lower economies may be less concerned with climate change and global warming because they are more concerned with other things.

The Two Measures:

- Median Income in 2018
- Per Capita GDP in 2019

How the states compare:

- North Carolina had the lowest median income in 2018, but is average in concern
- Kentucky had the lowest GDP in 2019 and is below average in concern

Why it could be influential:

Global warming is a debated topic between the right and left wing. The right wing tends to believe that global warming either does not exist or is not something to be concerned about. Therefore, those who voted for Trump in 2020 are most likely less concerned.

How the states compare:

- The state with the highest percentage of citizens who voted for Trump is Wyoming which is below average in concern
- The state with the lowest percentage is Vermont, which is above average in concern

Political Ideology

Linear Regression

While the model overall is significant, only **Political Ideology** has a statistically significant relationship with **Worried** among the independent variables. This means that political ideology is correlated to the level on concern about global warming.

Variable	P-Value	Direction
Political Ideology	<0.001 Significant	Negative
Education	0.631 Not Significant	Positive
Economy: Median Income 2018	0.494 Not Significant	Negative
Economy: Per Capita GDP 2019	0.156 Not Significant	Positive

Conclusion

States differ in their concern for global warming primarily due to political ideologies, as evidenced by the linear regression model which found that the relationship between political ideologies and level of concern for global warming is statistically significant. States with more conservative or Republican-leaning populations tend to exhibit less concern for global warming, likely reflecting ideological skepticism toward climate policies or prioritization of economic over environmental issues. Other factors, such as education, per capita GDP, and median income, were not statistically significant, suggesting that political alignment is a dominant driver of these differences. This highlights the impact of the varying political cultures in each state on their perception of global issues.

Overall:

- Political ideology is the likely explanation for the differing in concern about climate change by state
- Factors like Economy and Education do not impact this significantly
